Problem - Solution Fit Canvas for ShopEZ:

The Problem-Solution Fit Canvas was used to analyze the relationship between online shoppers/sellers and the solution provided by ShopEZ. It aided in understanding the needs of both customers and sellers, order management problems, the behavior of users, limitations, and alternatives that exist. It further showed how ShopEZ can solve these problems through its centralized marketplace platform.

Customer Segment (CS):

The intended customer segment for ShopEZ is customers who want to purchase products online, small sellers who need an easy way to list and sell products, and platform managers who require a simple way to oversee marketplace operations. Customers need an easier way to discover and buy products, and sellers need a better way to manage their listings and orders.

Jobs-to-be-Done / Problems (J&P):

The three key responsibilities are to discover products easily, place secure online orders, and manage order fulfilment efficiently. The ShopEZ solution fulfils these requirements by including product search and filtering, a shopping cart, checkout with order tracking, and seller product management tools.

Triggers (TR):

Some of the primary factors that compel users to look for a better solution are difficulty finding trustworthy sellers, time consumed comparing products across multiple sites, and the tedious process of tracking an order after purchase. In response to these challenges, ShopEZ offers a single platform for browsing, buying and tracking orders.

Emotions Before / After (EM):

Before signing up for ShopEZ, customers usually feel frustration, hesitation, and uncertainty about product quality and seller reliability. After using the platform, however, customers feel confidence and satisfaction because of being able to find and purchase products with a transparent, trackable order process.

Available Solutions (AS):

These include existing platforms like individual seller websites and generic classifieds listings. The problem with these solutions is that they are fragmented and inconsistent in experience. ShopEZ bridges the gap through a single, consistent marketplace that is easy to use and convenient.

Customer Constraints (CC):

The key constraints include limited access to trustworthy seller information, time spent comparing products across platforms, and untracked orders. ShopEZ solves these constraints by providing seller-attributed product listings, secure authentication, and order status tracking.

Behavior (BE):

Customers will search for products themselves, filter by category and price, and place orders directly. Customers can indirectly rely on product ratings, recommendations from friends, and comparisons between sellers when making purchase decisions. These activities are covered by ShopEZ.

Channels of Behavior (CH):

The online channels include search engines, mobile browsers, and social media links for product discovery. Offline channels involve word-of-mouth recommendations from family and friends. The target audience of ShopEZ uses both these channels equally.

Problem Root Causes (RC):

The reason for the problem lies in the fact that there is no single platform for managing customer-seller-administrator relations effectively and easily. The traditional way of shopping across multiple individual seller sites takes much more time than it should and includes many unnecessary steps. ShopEZ has been created with the aim of overcoming these obstacles.

Your Solution (SL):

ShopEZ is an e-commerce platform built using the MERN Stack that addresses the issue. The platform allows customers to browse and purchase products from verified sellers, track order status, while sellers can manage their product listings and administrators can monitor users, products, and orders across the system.
